Structure and configuration of MQ-2 gas sensor is shown as Fig. 1 (Configuration A or B), sensor composed by micro Al<sub>2</sub>O<sub>3</sub> ceramic tube, Tin Dioxide (SnO<sub>2</sub>) sensitive layer, measuring electrode and heater are fixed into a

crust made by plastic and stainless steel net. The heater provides necessary work conditions for work of sensitive components. The enveloped MQ-2 have 6 pin ,4 of them are used to fetch signals, and other 2 are used for providing heating current.

Electric parameter measurement circuit is shown as Fig.2

Ro: sensor resistance at 1000ppm of H<sub>2</sub> in the clean air.

Rs: sensor resistance at various concentrations of gases.

Fig.4 is shows the typical dependence of the MQ-2 on temperature and humidity.

Ro: sensor resistance at 1000ppm of H<sub>2</sub> in air at 33%RH and 20 degree.

Rs: sensor resistance at 1000ppm of H<sub>2</sub> at different temperatures and humidities.

#### SENSITIVITY ADJUSTMENT

Resistance value of MQ-2 is difference to various kinds and various concentration gases. So, When using this components, sensitivity adjustment is very necessary. we recommend that you calibrate the detector for 1000ppm liquified petroleum gas<LPG>, or 1000ppm iso-butane<i-C<sub>4</sub>H<sub>10</sub>> concentration in air and use value of Load resistance that (R<sub>L</sub>) about 20 K (5K to 47 K ).

When accurately measuring, the proper alarm point for the gas detector should be determined after considering the temperature and humidity influence.
